slave redirect to master site

Posted by ryscript - 2010/06/11 09:53

I have created a slave site, it successfully created no error, but when I visit to the slave site it redirect to master site.

I am using the latest multisite V1.2.31, installed successfully.

what I missed? or there is any configuration need to modify.?
but it create database and tables.

symbolic links: allowed
deploy dir: home/*****/public_html/{site_id}

please help me.

The most of frequent reason is a problem in spelling the domain name in the slave.
Check that you have the www and without www definition.
Sometimes also http and httpS.

When JMS does not arrive to find the URL in the list of domain that are defined in JMS, it displays the master website.

hi edwin thanks for your quick reply,

it seems that after creating a slave site., it doesn't create a folder in a root directory.

the deploy directory is deploy dir: home/*****/public_html/{site_id}

so after creating an slave site it create a directory in the deploy dir but it can't.
but it successfully create a site :(it seems burden for me to undertand this. what a missed configuration.

the list of domain in is
{site_url}/{site_id}
so the output would be SITE_URL/SLAVE SITE. including w/o www.

_____

If the URL is {site_url}/{site_id}
then you have to deploy the site into the {root}/{site_id} and click on check box to request create the deploy directory when not present.

Review the yellow icon that give you all meaning of the keywords
