error when creating a slave website

Posted by phil - 2010/07/16 14:35

---

before I get into big explanations, someone would have ever had this type of error when creating a slave website ?

"Le répertoire de déploiement n´existe pas."

the directory in question exists yet on the server with the right permissions...
if someone with an idea, it is welcome :D

thank you in advance

edit : here is not the right place for this post, sorry. :blush:

This is a permission problem that may be due to the open_basedir configuration that does not allow deploy something in this directory.
Also check the owner and group of this deploy directory.

Such kind of problem happen frequently on Plesk endvironement.

This may be also due to the fact that files and folders are created by another owner like "apache" or "nobody".
This happen when suPHP apaches module is not present.

I all cases this is a problem of permissions that is not provided to the directory where you want to deploy the website.

Edwin thank you, it was a rights issue.
Otherwise this component works really well :)
