Slave Site Creating Problem.

Posted by hnsight_jms - 2010/07/24 08:22

Dear Sir,

On the behalf of Mr. Rene I want to ask something from all of you. I am developer of Mr. Rene. I am creating a slave site on subdomain pcgclean.clairitynow.com and the master site is demo.clairitynow.com. So when I am creating the slave site none of all files will be copied on the slave site. Kindly help me what is the issue. The directory has full read write access (0777) but I am not geting the perfect results can I make any path issue.

I made a directory in the demo.clairitynow.com named as demo2 when I created the slave site in demo2, it is working perfectly.

Kindly help me I will be waiting for your reply.
Best Regards
Habib

If you are deploying the slave sites into a directory beside the master or in a totally different directory, you may have to open some security depending on your environement and hosting.
If you are using Plesk or Direct Admin or similar HTTP Server administration tool, perhaps you have to also check the open_basedir parmeter that may restrict the access of the directory (event when 777 is put on the directory).
On Windows platform, you may also have to check the security relative to the directories.

Also check the parent directories.

As you mentioned it with your "demo2" test, this is a permission problem that must be solved by the administrator of this server (or you if you are the administrator).
