JPATH_BASE issues
Posted by DaveC - 2010/08/25 03:06

Hi Edwin

I have dynamic virtual hosts setup correctly and the sub domains are working perfectly without modifying the vhosts.conf every time I add a site.

The issue I am now faced with is the JPATH_BASE is different for the subdomain and actual donain. You can see an example with the following urls. They both point to the same site.

http://133rcnovice.isonomy.us/
http://www.rcnovice.com/

The very first line echos JPATH_BASE

I can easily fix this by adding a documentroot for each domain in vhosts.conf but I would rather have a more dynamic solution.

Any ideas would be appreciate.
Dave

JPATH_BASE is computed by Joomla and is based on your document root.
This is the first time that Joomla compute.
This is conditioned by your document root.

Just have a look in joomla /index.php file. This is the second define.
define('JPATH_BASE', dirname(__FILE__));

So provide the correct document root directory in your http server configuration.

Understood, but for whatever reason this is not being picked up correctly as per my example above.

Perhaps you are not located in the place where you think it.
I can tell you that Joomla setup correctly the JPATH_BASE.
Perhaps your hosting has a specific think that create an alias or mount a disk with another path or something like that. I don't know.

NO, Both of those sites point to the exact same site. I know exactly the path that the sites are on. It is a dedicated server.

These site above are exactly the same. I added to the HTML of the template.
