Problem with path to images folder

Posted by dustdog - 2010/09/09 14:45

Hi, I'm having trouble with the path to the images folder in my slave sites.
The images folder from the master is set to 'copy'.
All slaves have in their domainlist the domainname (with and without the 'www', for example http://www.slave1.com) and they have the full path form the masterdomain: http://www.masterdomain.com/multisites/slave1

The last one is showing the images just fine, but when I use the domain-url (http://www.slave1.com) it shows a broken image link because the path in the source contains '/multisites/slave1/images/stories' while it should only contain '/images/stories'.

Cheers,
Guy

Which platform do you use ?
Does the Symbolic Link is allowed ?
Did you deployed the slave site into a specific directory or just let the field empty ?
Did you specify something the the images folder paramter in addition of the action "copy" ?

If Symbolic Link is allowed the procedure to have a specific directory is explained in tutorial video CP-05.

http://www.jms2win.com/tutorial#jms12x-CP-05

I summary:
- Domain name = {site_url}/multisites/{site_id}
  www.{site_id}.com
  {site_id}.com

- Select a template website to replicate
- Define a new table prefix
- Deploy folder = {site_dir}
- Image folder = empty
- Image action = copy
