Modifying Domains
Posted by DaveC - 2010/09/16 19:03

Hello

I have a component that handles virtual hosts at the site level. I wish to update config_multisites.php using 4.2.1.1.function updateSiteInfo($site_id, $values)

Would I need to make two separate calls to update both $domains and $indexdomains ?

I assume I would need to pass an array with all values.

Thanks
Dave

YES the values is an array.
If you modify the internal domain and indexdomain, you will also have to rebuild the master index (createMasterIndex).

Hello

Would one of these be the correct format of the array? Which one?

Values = Array (=> http://test2.com => http://test1.com => http://test.com => http://slave.example.com)

Values = Array (=> Array (=> http://test2.com => http://test1.com => http://test.com => http://slave.example.com))

Thanks
Dave

I think you can cross-check yourself with a debugger.
This is an array without any key.
So the solution is none of them or perhaps the first one.
