Slave Sites with different Email_from addresses

Posted by rotwildmarcy - 2011/02/23 14:05

Hi Edwin,

Finally i managed to get everything working with this great component.

I just need to make one last addition and not sure how to go ahead :

All Slave sites are using the same master DB.

Now, when sending Emails through the standard com_contact form the Admin Emailadress of the Master Site is used as the Email_from address. This is what i need to customize.

(For the CC copy to the enduser the mailfrom address out of the slave configuration.php is used - so that works fine.)

Any suggestions how to get this running ?

thanks for your help !

Marcel

I think that the configuration of the "email from" address is the one that you have in the "Global Configuration" / server tabs / "mail from" field.
As you have as many "configuration.php" files as slave site, this should be the slave site "configuration.php" that is used.

So verify the slave site "global configuration" that is in charge to update the "configuraion.php" file.

Hi Edwin,

thanks for your email.

When sending an email through the contact form the mail address used is the one linked to this contact (which is the same for all as it's in DB) and not the one which is written in configuration.php. Exactly this

is my problem.

Do you have any idea how to fix this?

thanks !

Marcel
