Need directions badly
Posted by kkonline - 2011/03/09 09:44

Hi,

Can you help me?

I got two websites:

1st is www.meter.com.my, www.sensormalaysia.com.

Now I would like to use www.meter.com.my as my master site. Then when I update www.meter.com.my, I want the www.sensormalaysia.com to be updated too.

How can I achieve this?

can someone help me pls?

Thanks,
Steve

/public_html/www.meter.com.my and /public_html/sensormalaysia.com

www.meter.com.my - addon domain, www.sensormalaysia.com - addon domain

The question is what do you mean by the word "update".

You can update an extension to fix bugs or you can update the content of an extension.

If you want update the PHP code of the extension, see the chapter 8 of the user manual that explain the difference between an update and an upgrade.
The update of an extension generally mean install bug fixes.
The upgrade of an extension means that you may have an impact on the DB layout.

The update can be installed only once.

Concerning the upgrade of an extension, you have to re-isntall it in each website to have the upgrade processing performed and modify the DB layout according the specific rule present in the extension.

If the update means modifying the content of an extension - in example add a user that you want to see automatically added in another website, in this case, this mean that you want to share the content of extension.
In this case, you have to share the extension to have the same content between the websites. The sharing of user (but also true for sharing of extension) is illustrated in video 16.

What I mean is for example, I added a new article and a new menu item. And I want the other website to add the same new article too automatically.

When using the "Article Sharing for JMS", you can automatically display articles coming from other websites.

So if you decide to display a category as a blog that contain article 1 & 2 and later you add an article 3, it will be automatically displayed.
See for the example the video on the article sharing that show how it works
http://tutorial.jms2win.com/joomla/multisite-12x/articlesharingforjms/index.html

The article sharing for JMS works for Joomla 1.5

I bought the ARTICLE SHARING VERSION 1.0 module.

I created a menu item in the master with the article from my slave site.

The menu item appears on my master site but not on the salve site.

How to make it appear on the slave site?

Ok. I got it done.

One more question: What is the meaning of template option in JMV multisites ?

What do you mean by "template option" ?
Where do you see that ?

In JMS Multisites the menu "templates" makes reference to "website template".
The rule that define how to replicate or create a websites.
This describe the "website template" that must be used to replicate a website.

So can you give a more detailed description of the "option template".

---

1. "website template" that must be used to replicate a website
This means which template to use to replicate a website?

2. If let say I want to create a new slave site for www.meter.com.my, HOW can I create a slave site using jms ?

The menu and the "article sharing" are two differents things.

When you create a menu, you defined the "menu type" and can select different extension.
The "Article Sharing for JMS" is one of the menu type.

If the menu item appears in the master, this is probably because you defined the menu item in the master and not in the slave.

The "Article Sharing for JMS" just allows you to read articles comaing from other websites but do not share the menu item definition.
If you want to get menu item from another website, see the "Multisites Menu Items" product.
