new installation and slave site issue

Posted by avush96 - 2011/04/07 00:05

Hi,
I had just install the JMS and created a slave site, slave1 for the sub domain:http://israelim.derberliton.de/ for my Master site http://derberliton.de/
how ever, there is not new joomla installation when clicking the link form backend http://israelim.derberliton.de/
am I missing something here??
thanks,
Avi

If a somain is not correctly spelled, or does not exists in the list of slave site, this display the master website.
You must also ensure that the slave site was saved with success. Otherwise, it is not necessary declared completly into JMS Multisites.

Did you put the "/" at the end of each domain ?
If yes, perhaps you can try removing it.

Hi,
slave was saved successfully.status- confirmed
no misspelling in the sub-domain " israelim.derberliton.de" and it is in the list
"/" is created
what now??
thanks,
Avi

Check that your HTTP Server has not defined the subdomain as a www.israelim.derberliton.de
If you want that we have a look on your server, this is possible with our billable support that you can order at
http://www.jms2win.com/en/joomla-multisite?page=shop.product_details&flypage=flypage_multisites.tpl&product_id=35&category_id=1

Hi,
I do not follow you!
I had made a new sub domain by host gator without any data base.
installed the JMS and made new slave site with the sub domain listed, like in your Tutorial.
so what is the problem now? I have just paid 50 euro for this comp. ...and I do expect for a little more support on the issue,
thanks

I have the same exact issue....nothing works

I followed your tutorial http://tutorial.jms2win.com/joomla/multisite-12x/joomla-subsite-overview/ but it did not work:

see http://screencast.com/t/TjB5ZD4bO7gs

if you are using hostgator with baby or business plan, see the video CP-04 that show how to setup the cPanel and JMS Multisites with a subdomain.

In cPanel, create a subdomain and specific a document root directory.
The key element is to provide exactly the same path in Jms Multi Sites when you deploy the slave site.

If you are not sure of the path, try copy the "hello word" php file into the subdomain root directory and the path will be displayed.
This is the full path that must be entered in the deployed folder field in Jms Multi Sites.

Once you have created the subdomain in cPanel and created the slave site into Jms Multisites, verify that you have effectivelly all the symbolic link created into the subdomain directory.
You should also have the "installation" directory created to allow executing the "joomla installer".

Re:new installation and slave site issue
Posted by edwin2win - 2011/04/12 17:18

_____

First you didn't apply the video correctly as you didn't enter the "deploy folder" path.

You are defining a website with a subdomain.
In the slave site definition, you didn't put any "deploy folder".
So in this case, you have to verify the setup of your HTTP Server to assign the subdomain with the same path as your master "/hspehere/local/nnnn/ttechsolutions.com"

If you have put another path in your subdomain defined in your HTTP Server (apache) using a cPanel or other tool then you have to put this value in the "deploy folder" parameter.

They must be identical.

_____

I am not sure if I follow you. I followed the same video included in the this thread exactly.

Can you please give some more specific example. you are saying "deploy folder" but in ut tutorial, u did not put any deploy folder...

Please explain

Re:new installation and slave site issue

Posted by edwin2win - 2011/04/21 12:37

In your sample the "DEPLOY FOLDER" field is empty.
You must introduce a value.
It can NOT be empty.

See for example the video 9 and the sample value that are :

* Site ID = slave1
* Domain name = {site_url}/multisites/{site_id}
* DEPLOY DIRECTORY = {site_dir}

---

look at ur video 9

http://tutorial.jms2win.com/joomla/multisite-12x/joomla-subsite-overview/

U DID NOT add any deploy folder....

please share a link to a video that allows me to easily complete this process

No configuration file found and no installation code available. Exiting...

see http://screencast.com/t/PWHxhqUTyi76

Re:new installation and slave site issue
Posted by edwin2win - 2011/06/03 16:26

As the message tells you, this means that you don't have any "/installation" directory present and no "configuration.php" file present in the deployed directory.

So if you are creating a fresh slave site, verify that you have all the patches installed and that the "/installation" directory is correctly restored.

Verify also that in the deployed directory you effectivelly have the "/installation" directory present to allow creating the fresh slave site.

Based on your video, I don't see any symbolic link created.
Perhaps this is you FTP tool that does not display it but you have to verify that you have the symbolic links created.

JMS,

I am completely lost. This instruction seems to be for a person computer science or a joomla expert.

I have set up wordpress multisites and the instructions is quite simple. Your video tutorial is very hard to understand and not complete. I followed video 9 and I did not see what you are saying.

I am going to give this one more try. I want to make a slave site that shares the users,tempalte and modules from the master site...

Do you have one complete video that can show this?

I have already told you that you have to check if you have an installation directory or "configuration.php" in the deployed folder;
If this is not the case, this explain the error message.

If you want that we install, setup your environment, this is possible with our billable support that you can order at
http://www.jms2win.com/en/joomla-multisite?page=shop.product_details&flypage=flypage_multisites.tpl&product_id=35&category_id=1

To share the users, see the video 16.
