Setup Problem

Posted by socialfan - 2011/04/17 22:26

Hello,

I just bought this componend and spend a view hours understaning how it works.

My setup is as follows:

- Mastersite on domain.de
- Target create regionalized mirrors on subdomains on different domain (domain.eu).

In PLESK I created differnet subdomains as domain alias of the targeteted top level domain. Example: at.domain.eu ch.domain.eu ...

Installed the JMS on the master domain (domain.de) and entered the subdomain in the process of creating a copy. Create deploy directory: ticked. all other empty.

Now... I think i should be able to see the joomla installation by visiting the configured subdomain....

However I get always redirected to the master domain...
