How to configure a domain with 'ñ'
Posted by janunez - 2011/07/09 22:25
_____

Hi,

I need a configurate a domain with 'ñ' (migraña.cl).

How can I do that ?

I have tested with:
http://www.migraña.cl
http://www.xn--migraa-0wa.cl
http://www.migra&#65533;.cl

It doesn't work because the redirect links to the master site, but not properly to the slave site.

Can somebody help me ?

Javier

_____

Yes you can use special characters in the a domain but in this case, you need to enter their ascii equivalent into the website definition.

See also the website that explain the internationalized domain name.

http://en.wikipedia.org/wiki/Internationalized_domain_name

Theorically, the host value for
migraña.cl
is
xn--migraa-0wa.cl

You can also add a firefox "tamper" addon module to see the header of the page and discover the ascii value.
