No database and joomla installation in slave site

Posted by peforever - 2011/08/17 07:59

Hello,
I installed JMS2Win 1.2.61 in Joomla 1.5.23 (checked patches).
I go to manage sites and create a slave site.
After Save, no database information is displayed.
When i go to the site, there is no joomla installation requested.
I look in FTP, the directory folder is in multisites but empty.
I have tried this on 2 different web hosts.
Please help.
Thanks

First, check that you have correctly installed the patches.
You should have the "/installation" directory restored in the master website.

Do you have the "Symbolic Links" functionality avaialble.
Check with video 4 to 7

If symbolic link is OK, verify that you deployed the website into a specific directory.
The path depend of your domain URL.
Use for example the video 9 procedure
http://www.jms2win.com/en/tutorial/259

Sample values:

* Site ID = slave1
* Domain name = {site_url}/multisites/{site_id}
* Deploy directory = {site_dir}

Verify that you have the symbolic links created and that the "/installation" directory contain something.
