Synchronizing Slave --> Master

Posted by jennylow - 2011/08/31 22:29

Hi,

I have separate databases for the slave site and the master site. The slave site is the live site and master site is the development site.
I need to do a reverse synch because users register or post from the live site and the data goes to the live site's db. How do I synchronize the live Master site's data to match the live site data?

The concept of Jms Multisite is not based on synchronization that suppose that you duplicated the data. The concept of Jms multisites is based on the sharing. So there is no duplicated data.

The sharing of the users is something decided when you create the website because you need ot have the same user ID for all the websites.

If you want to share the users after that the websites are already created, you must ensure that all the records have the same information before deleting the tables for the users and replacing them by a link. As you will delete mysql table to replace by a link, you must ensure that all the records that will be deleted from the mysql tables are present in the future link.

In your case, the problem is more complex as you can not create a JMS template rule that will copy the slave site to build the master.
The only solution would be to do it manually or replace the master "users" table and all the permission by the one present in the slave site and later share the users that will be present in the master to replace the one in the slave site.

If you want that help you doing such thing manually, this is possible with our billable support that you can order at
