---

Hello:

I need some advice for this:

I have this website, let's call it [www.website.net](http://www.website.net)

I will use a redirection plugin so that people in Spain, can be redirect to [es.website.net](http://es.website.net) and people from Portugal to [pt.website.net](http://pt.website.net)

For my experiences I think it's better not to share extensions.

Share Joomla instalation: Yes

Share Joomla and jomsocial users: Yes

Share templates: No

Share extensions: No

Share DB: No

What I want is that a user can have access to the different websites with the same login

Apreciate your suggestions

Thanks

Jose
