Websites Tools - Error Code 500

Posted by sando2011 - 2012/01/21 16:29

Have created/replicated the Master website into our first Slave website. When I go to the "Tools" tab in the JMS backend it produces the following error:
http://www.jms2win.com/images/fbfiles/images/Selection_042.png
I assume that until this is fixed we cannot change the sharing options for extensions/tables and so the only way to change any sharing options is to recreate the slave site from scratch, but it will still produce this error in the backend.

Error 500 is an "Internal Server Error" returned by your sever by the Ajax call.

Verify that the slave site is correctly created and that you can access it correctly.
Perhaps this is due to a wrong DB connection for this slave site.
