Problem with /templates directory

Posted by JerryCurwen - 2012/02/04 15:05

Hello,

at first:
I'm using JMS Multi Sites on a ubuntu Linux VM Server with Plesk. JMS works and i can connect to every slavesite an slavesite admin panel.

I have a problem with the /templates folder of my joomla installation. I have created a new template rule with a full copy of the /templates folder and i have created a new slave site with a fresh installation. The "joomla" template folder i have redirected with a full copy to my slave site deploy directory.

If i make changes in the css files of my slave site it have no effects on the frontend (design) of my slave site. Only if i change the css files of the "joomla"/master site (where i have copied the templates folder) it haves effects on my slave site but on my master site too.

I thought that i can copy the /templates folder to have for each page its own frontend template (design). Can not each page have its own frontend template in its own templates folder? So i have only one template(design) each page in its on template directory.

EX:

Mastersite Frontend Template(Design):
httpdcos/templates/template_name

SOLVED

The Problem was that my domains were mapped to the root directory of my master site. So the Slavesite design was mapped to the master template folder. Now i haved mapped the Domain directly to the folder of my subsites an now evrything works fine.

Jerry!

Pleased to see that you found the solution yourself.
Congratulation.
