How can I set up unique slave sitemap.xml

Posted by mulligan - 2012/03/08 20:17

I have ten slave sites. I need each site to have its own unique sitemap.xml. Do I change SYMBOLIC LINK in templates? To what? Where do I upload the xml file? Thanks!

Create a JMS Template rule where put the action = copy instead of the Symbolic Link for the sitemap.xml.

The JMS templates "folder" tabs allows you defining how you create the new directory structure and if you want to have symbolic link, copy or ignore some files and folders.
