XIUS : Unpossible to load css and js files

Posted by titus - 2012/05/31 12:58

Hi Edwin,
I have a problem with XIUS.
All is ok in the finctionnalities of the component and plugins (as far as i know today for my test), but there is a problem with the loading of the css and js files in frontend.

I take for example the css file, in browser panel i see call is done like this :
MYSITE.com/mnt/data/vhosts/.../component/com_xius/assets/css/panel.css

My question is, does you have to make a little patch ? Or do you know what can i modify to make it ok like this :
www.MYSITE.com/templates/MYTEMP...assets/css/panel.css

P.S : I have post in xius forum as well

It seems this is a bug in the computation of the path used by the extension to add the CSS in the page. The value that you illustrate seems to use the location on your disk and I suspect that the extension is trying to compute a location of the file on the disk and get a wrong answer. This can happen if the extension perform a dirname(__FILE__) that returns a physical location on the disk that is not necessary match the JPATH_xxx value. This is illustrated with the /mnt/data/vhost/

If the extension want to compute a path dynamically, it must use the JPATH_xxxx that contain the correct root, base, path and not use dirname() or real_path that return a physical location that does not match necessary the website document root. They must use the Joomla JPATH values to compute the location on the disk.

So this is what i supposed before posting... But can't find where it is in there files.
I will put the link to this post on their forum, thanks Edwin ;)

Hi Edwin,
there is there return :

"I have checked on your site.
We are using joomla standards and its creating some issues with multiSite components.
There is a notice, shown in multisite component: "Some patches are not installed." so try to fix it.
Because it might create some issues.
Let me know if still you have same issue after fixing the patch issue."

To explain, the website concerned is a subsite... So i have this notice "patch not ok" on its administrator, but it is normal, we are ok ?
Main site is ok and in last versions for install and patches.

_____

Did you installed all the patches.

Remark, if you try to manage JMS from a slave site, this is normal that you get an error message as you can not convert as slave site into a master website.

As I don't know if you have the patches installed in the master website, I can not tell you more.

_____

That's what i respond (patches are installed)
Thanks
