Jomres Installation...

Posted by Earthwalker - 2012/06/07 04:18

Dear Edwin,

I have installed com_jomres successfully on both the master and the slave. (accommodation).
However, when I want to open component in front end I get the following error message:

Fatal error: Cannot redeclare jomresurl() (previously declared in /home/thabakai/domains/thabachweu.net/subdomains/master/public_html/jomres/integration.php:171) in /home/thabakai/domains/thabachweu.net/subdomains/accommodation/public_html/jomres/integration.php on line 193

Have you got any idea what this might mean and where I have to go and search?

Regards,
Tiaan Viljoen

Based on what I see in the jom_res/integration source, this file is probably included twice.

Do you have duplicated the /jomres directory in a slave site.

The path mention that you have a first call in
master/public_html/jomres/integration.php:171
accommodation/public_html/jomres/integration.php on line 193

Verify if you have a symbolic link on the /jomres directory.
Perhaps you have a duplicated jomres directory installed.

If you don't want to identify why the file is included twice, a quick an durty solution could be to add a test in the file itself to verify if it is already include.

Here it is something that you could use to get inspired.

```
if ( !defined( 'JOMRES_INTEGRATION'))
{
   define( 'JOMRES_INTEGRATION', true);

***** PUT HERE ALL THE SOURCE ******

}
```

Dear Edwin,

I do trust that you are fine? I am still struggling to install Jomres.
Yes indeed I copied a jomres folder to slave site, hehe...
Still did not figure out what you meant by the test, too much for me.

I installed from master and also shared from master, same error?

This is the error I get when accessing component from front end.

Fatal error: require_once() : Failed opening required '/home/thabakai/domains/thabachweu.net/subdomains/accommodation/public_html/jomres/integration.php' (include_path='.:/usr/lib/php:/usr/local/lib/php') in /home/thabakai/domains/thabachweu.net/subdomains/master/public_html/components/com_jomres/router.php on line 25

Perhaps you can figure out when looking at it quickly? I tries to enter backend?

Regards,
Tiaan Viljoen

This fatal error message means that a file is not present.

So check if you have correctly installed JomRes and if the file "integration.php"
exists in the directory
/home/thabakai/domains/thabachweu.net/subdomains/accommodation/public_html/jomres/

Based on this error message, it seems that the file does not exists or you don't have permission to access this file or folder.

I suspect that the jomres directory does not exists in the slave site.
I think you should have a symbolic link.
