Virtuemart ADD to Cart
Posted by robov - 2009/10/17 11:28

_____

I just tested the VM integration and it looks nice,
I have a master site
and a slave site
Different dirs, different URLS, different database, but share VM db

When I press ADD TO CARD the script redirect me to the master

Any suggestions?

_____

You have to update the VM Configuration to change the "security" parameter and the URL used by the slave site.
You have 2 URLs, one for site URL and second for seured URL.

By default when you have never save the VM configuration, JMS read the default one (master) and therefore retreive the master URL.

_____

Ok, thanks...
But when I login to the slave site than virtuemart breaks because the files are linked to the master and the DB is also linked to the master.
Where and how can I update the slave configuration?

All VM tables were linked to the master db at time of slave creation

p.s. Thank you for this wonderful component and your superb help

_____

NO, unfortunatelly, VM does not save the configuration into the DB and therefore is NOT shared.
This is the reason why I told you to go in the VM back-end and in its configuration.

You have to change the security tabs in the VM configuration.
The URL to acccess the VM back-end configuration is like
index.php?pshop_mode=admin&page=admin.show_cfg&option=com_virtuemart

So go in VM and select their menu configuration.

_____

There is something very wierd going on with my slave installation

The backend of the slave works fine. no problem there
However when I open VM in the backend teh links to the products, admin etc is
.com/administrator/ .....

Yet when I open this in the master the links show
.com/www/administrator/...

Any idea why this subdirectory www is removed in the VM backend of the slave?
Other menu items (outside VM) point nicely to the www

I am lost now...

_____

For the 4th time.
EDIT THE VM CONFIGURATION AND GIVE THE CORRECT LINK.

THE URL IS IN THE VM CONFIGURATION.

_____

SOLVED- The issue with the WWW missing is now solved

However:
I now have set the site and security url to point to the slave.
When I press add to cart it still jumps to the master site

==========

Re:Virtuemart ADD to Cart
Posted by edwin2win - 2009/10/17 17:24

I don't see how it can jump to another domain except if you have not defined the name correctly in JMS.

Check that the link used by the VM Add button is correctly produced.
(It should use the URL that you have specifed in the VM configuration).

If it is correct as I expect, you have later to check that you domain is correctly spelled in JMS and that you have for example defined the domain with both WWW and without the WWW.

When a domain is not defined in JMS, it automatically display the default one (the master).

Thanks...
I am getting closer

The slave config file contains
define('URL', 'http://www.metamedicine.com/www/');
define('SECUREURL', 'http://www.metamedicine.com/www/');

yet in the slave admin it mentions:
/administrator/components/com_virtuemart/virtuemart.cfg.php :: Writeable (=master)

yet the images and the add button still point to the master

in master jms setting:
deploy: /var/www/metamedicine_com/www/
domainnames http://www.metamedicine.com (tried also http://www.metamedicine.com/www/)

Re:Virtuemart ADD to Cart
Posted by robov - 2009/10/17 17:49

When I edit the VM main config into

```
echo "---:".MULTISITES_ID;
if ( defined( 'MULTISITES_ID') && file_exists( dirname(__FILE__) .DS. 'virtuemart.' .MULTISITES_ID.
'.cfg.php')) {
```

and then the slave shows

----: MULTISITES_ID
Indicating that MULTISITES_ID is not defined

Any suggestions?

_____

Sorry, but I don't see.
If you have correctly installed the JMS patches and the URL are correctly defined then I don't see the origin.

Normally VM use the field URL or SECUREUL to compute the link.
So the link should be OK except if you don't have installed the JMS patches.

If you want that we investigate on your server, this is possible with our billable support that you can order on
http://www.jms2win.com/download?page=shop.product_details&flypage=flypage.tpl&product_id=35&category_id=1

Re:Virtuemart ADD to Cart

Posted by robov - 2009/10/17 18:41

_____

In response to
echo "---:".MULTISITES_ID; in my basic VM config I get the following results

In the backend of my slave it shows the correct ID
---:metamedicine_commmcfg

In the frontend of my slave
---:MULTISITES_ID

I have installed the latest version and incl all patches are OK
Joomla Multi Sites version: 1.2.10 (Latest available: 1.2.10)
Patches definition version: 1.2.13 (Latest available: 1.2.13)

It looks like the VM patch does not load the MULTISITES_ID in the frontend
(but it does it correctly on the backend)

Where is this code that handles the setting of this define in the frontend ?

JMS Master config looks ok
Site ID (*): metamedicine_com
Domain names: http://www.metamedicine.com
deploy : /var/www/metamedicine_com/www/

Please advise...

_____

When I add
define('MULTISITES_ID','metamedicine_com');

To the joomla site config in the slave, then the add button redirects correctly to metamedicine.com
However, then the images are not shown.

Please advise, as I am getting frustrated with this component

_____

The define MULTISITES is automatically compute by JMS when you are displaying the correct websites.
So if you see the correct content, this means that it is dedined.
So you don't have to add it twice.

If the JMS patch for the VM Configuration wrapper is correctly installed in the master, you should read the correct VM config file.

So if seems that you have patches not installed or I don't know the reason.

Re:Virtuemart ADD to Cart
Posted by robov - 2009/10/17 19:49

_____

MASTER site: All patches are installed like you can see below.
Joomla Multi Sites version: 1.2.10 (Latest available: 1.2.10)
Patches definition version: 1.2.13 (Latest available: 1.2.13)
Files Status
administrator/components/com_multisites/install.xml
OK
administrator/index.php
OK
administrator/includes/defines.php
OK
includes/defines.php
OK
includes/defines_multisites.php

OK
includes/multisites.php
OK
installation
OK
installation/includes/defines.php
OK
installation/installer/helper.php
OK
installation/installer/jajax.php
OK
xmlrpc/includes/defines.php
OK
configuration.php
OK
administrator/components/com_config/controllers/application.php
OK
administrator/components/com_installer/models/templates.php
OK
administrator/components/com_modules/models/module.php
OK
administrator/components/com_templates/admin.templates.html.php
OK
administrator/components/com_templates/controller.php
OK
libraries/joomla/application/application.php
OK
libraries/joomla/document/html/html.php
OK
libraries/joomla/filesystem/folder.php
OK
libraries/joomla/session/session.php
OK
components/com_content/helpers/route.php
OK
plugins/system/remember.php
OK
administrator/components/com_jce/installer/installer.php
OK
administrator/components/com_virtuemart/classes/ps_checkout.php
OK
administrator/components/com_virtuemart/classes/ps_config.php
OK
administrator/components/com_virtuemart/classes/ps_order.php
OK
administrator/components/com_virtuemart/virtuemart.cfg.php
OK

Please let me know :
1) where the multisites_id is defined by JMS
2) where in VM the connfiguration of the frontend is retrieved

Then I will look into the code to see what happens, and let you know when it is solved.

---

p.s. I even downloaded the newest version and installed that... all went fine... no errors whatsoever

==========

Re:Virtuemart ADD to Cart
Posted by edwin2win - 2009/10/17 21:15

The Multisites ID is computed at the begining of the processing before Joomla start.

Normally, if the VM virtuemart.cfg.php is called directly (that normally is not the case), it contain a wrapper that allow to call JMS to compute the multisites id.

This is a complex algorithm that I don't want to develop here.

In summary, if the correct website is displayed, this means that multisites id is defined because this is it that trigger the dispaly of the correct webpage.

If your add button has not the correct URL then I don't know the reason.

You have ordered JMS on www.jms2win.com that use VirtueMart and you had any problem with the URL. It uses exactly the same code.
So the problem is somewhere else and I don't know where.
The only solution is to debug your specific environment.

Based on your trace, it seems that the administrator/components/com_virtuemart/virtuemart.cfg.php is correctly installed. So I don't know why.

Perhaps you are using a specific themes (templates) that would bypass everything.
I don't know.

Re:Virtuemart ADD to Cart
Posted by robov - 2009/10/18 10:05

Even with the default template for Joomla and VM the component does not work
I already spend way too much time to get this component working the way I want to.

I revert back to separate installs of joomla and VM

Please refund my money and I will delete your component

==========
