Patch creation for components

Posted by hassanali20 - 2009/10/28 17:05

Hello JMS,

We are using some components which are not declared in Joomla Multiple Sites and User Sharing. http://www.jms2win.com/component/content/article/135.

In order to install those components in the different slave sites from tool manager, I think we need to have patches for those components.Please find the list of components which we not found in http://www.jms2win.com/component/content/article/135

com_cache
com_camelcitycontent2
com_categories
com_fpslideshow
com_polls
com_jposition
com_sitemap
com_tag
com_version
com_hwdvid
com_eweather

Can you please tell us the steps to write patches for a new component to work from Tool manager

First when an extension is not yet defined in the JMS tools, you can install them directly in the slave sites like that was the procedure with JMS 1.1.x before we create the JMS tools.

So this is not blocking as you can already re-install them in the slave site back-end.

Amoung all the list of component that you give, there are some core joomla one that does not require a definition as they are pre-installed by joomla itself. (ie. com_cache, com_categories, ...)

For the other one, if you want that we review them for a possible definition in a next release of JMS, you have to send us those extension in attachement of an email.

_____

I suppose you have found your error because I have received the email.
Perhaps you have forgotten the ".com"
