Joom!Fish

Posted by desklance - 2010/02/15 20:35

Hello,

We have installed the Jms MultiSite extension and it works just fine until now, however, we noticed that if we create a Main Menu on the slave site, the slave menu ID's per link assume Joom!Fish default translation, I mean, for instance;

Master Site

Main Menu > Weblog (ID #3) - Joom!Fish menu translation for this is "Weblog" on Master.

Slave Site > Hosting (ID #3) - Menu returns "Weblog" as translation by default.

Any way to hack this so that Joom!Fish may work ok? Or it's better to install and independent Joom!Fish installation on the slave site?

Thank you.
