Sharing Sobi2 - create a filtered view

Posted by slboone - 2010/02/24 01:10

Hi Edwin,

I know that basically we are creating a view for each slave site to share the sobi2 tables with the main site, but would it be possible to filter this view for each slave? Basically I need all the data to be entered into Sobi2 from the main site, but when a particular state accesses the data, they see only their state. (i.e. Georgia)

Thanks for any suggestions or help on this one!

Sondra

Sondra doing that mean that we change the SOBI2 components to add an information concerniing the Site ID that is recording the info.
This can only be imagines with specific development and will result with a specific "Multisite SOBI2".
We already did something similar for another extension but this can only be achieved with billable support and cannot be provided in standard. This require to create a specific SOBI2. This may require few days of development to change SOBI2 for that.

How much would it cost and how quickly can it be done? Also would you be able to tell me where the changes are so that I can re-implement it for other sites? Thank you so much!
