

url pb with com_multisitescontent and com_sh404sef

Posted by epanda - 2010/02/25 15:12

hi there,

does anyone know how i can remove the 'site_id' var from the url after sef did its job... ?

joomla 1.5.14

SH404SEF 1.5.6.398

multisitescontent 1.0.10

thank you for helping!

You can enter customized URL in sh404drf and therefore hidden it.

Just enter the URL you want to force with a specific SEF and let sh404sef doing its job.

hi, thank you for ur reply.

Yes i can do customized URL (and i might if i dunn find better way), but the thing is that i have too many url to customize...

Cz my site has 4 languages available and sharing content through my multisites might become a common task for my multiple admins...

anyway, i tried to make a sh404sef ext plugin (as usual to set rewrite rules) but if i use this 'com_multisitescontent.php' extension, the sh404sef does its job but it also prevents com_multisitescontent's url rewriting process (which i cannot find?!)

So with this extension i made i can remove 'site_id' but no other vars from url! ...

here is what i put in 'com_multisitescontent.php':

```
//shRemoveFromGETVarsList('option');
shRemoveFromGETVarsList('lang');
/* if (!empty($view))
shRemoveFromGETVarsList('view');
if (!empty($layout))
shRemoveFromGETVarsList('layout');
if (!empty($Itemid))
```

```
shRemoveFromGETVarsList('Itemid');  
if (!empty($id))  
shRemoveFromGETVarsList('id');*/  
if (!empty($limit))  
shRemoveFromGETVarsList('limit');  
if (isset($limitstart))  
shRemoveFromGETVarsList('limitstart');  
if (isset($site_id))  
shRemoveFromGETVarsList('site_id');
```

what is commented is the vars needed for the process to work fine.

perhaps if i find the rewrite process of multisitescontent i can paste the code in this sh404sef ext i made...

what do u think of it?

i'm getting workin on it and will post my solution if i work some out, please let me know if u have any better idea than mine.

thank u for ya time.

The rewrite process is NOT in the multisitescontent.
This is the original one of Joomla (com_content).

If you want to change the rule, you can redevelop the "router.php" that is present in the com_content to take in account the "site_id" parameter that is not used by a standard joomla article.

As you have understood, we have just call (not redevelopped) some peace of code that is present in th joomla.

Hi epanda

Did you succeed in changing the router.php code?

How did you do that?

I still have the "site_id: ..."

Thanks

See our following reply where we describe an alternate solution

<http://www.jms2win.com/forum/25-extensions-compatibility/5099-acesef-?limit=6&start=6>

Perhaps we will implement a new router.php to replace the standard joomla one with the objective to cleanup the URL that is not done by joomla itself.

We have updated the "Article Sharing for JMS" to try hide the site ID when possible.

See the change history for the procedure to update.

<http://www.jms2win.com/faq/article-sharing-version-10x>
