Smart Flash Header com_novasfh writes to file???

Posted by netstepinc - 2010/03/25 04:31

I've been using com_novasfh by ProJoom for quite a while and loving it.

However, it writes a file to:
modules/mod_novasfh/engine/novasfh_353.xml (353=module ID).

This extension is listed on your module compatibility page:
http://www.jms2win.com/component/content/article/135

IF it writes a file to the shared modules directory, what if multiple sites write the same module ID XML file?

Won't that screw things up?

I haven't gotten a response from the developer about this.

Can you describe the procedure to produce such "xml" file.
Give a sample.
I try to identify the place where such "xml" file is produced without success.

Which NovaSHF version are you using.
I test the version 1.1.8
