JomSocial Video Player Licence Problem

Posted by Zappu - 2010/05/16 20:19

If you are running jomSocial within a multi-site way, you will have a problem with the video player licence on all shared or multisites, as the player will be called via the shared site url and not the main url to which the licence belongs.

Please, could you change some rules??? so the video player within JomSocial will be called via the org. Domain so the licence will be valid?

Can you tell us which version of JomSocial you are using.
We have the 1.6.283.

Can you also give us a screenshot of where you enter the license and describe in detail how to reproduce that.
When we browse the JomSocial configuration, we only see a place where a license is required in "remote storage" and concern the Amazon.

We are looking for this infos and we don't find it in JomSocial 1.6.
So if this is in a more recent JomSocial, please send us a copy in attachement of an exmail and also a detailled scenario on how to reproduce (with screenshot if possible).
