acesef -
Posted by muskes - 2010/08/24 02:12

Hallo Edwin,

after installing the acesef extension, it's not possible to create, edit or delete a slave in the frontend.

After pressing one of this buttons (create, edit or delete) you will be redirected to the mainpage like http://mysite.com/#

I installed the newest version of jms 1.2 and all the patches are up to date.

Please can you give me a tip?

best regards,

muskes

Would you please send me the acesef extension in the attachement of an email to allow me retry reproduce this behavior in the same condition.
See "contact us" for the email

I have redo the test with the aec that you sent to me and it works for me.

Perhaps you should review the AEC settings.
In my case, I have just installed AEC and use all defaut values.
I just have enable Global Configuration SEF and mod_rewrite

Hi Edwin. Im having an issue with this extension also. When I try to use SEF URLS on a "Article-Sharing" link I always get:

?site_id=%3Amaster_db%3A

after the SEF url.

I have tried to include that in the base url inside AceSEF and no matter what the menu click ads the this ID to my url.

all my menu items/internal links that are site specific work perfectly with JMS and AceSEF, its just the Articles that are shared across multiple domains that are changing my SEF links.

Thanks

The site ID is a parameter added with the "Article Sharing for JMS".
It is normal as we have not rewritten the Joomla article SEF.

Perhaps we will re-implement the Joomla article SEF to hide the site ID when possible but this is not available for the moment.

---

is it possible to hide the site ID with sh404sef? if I hand change each article I wish to SEF the url?

Im not opposed to buying that if it will work for this need.

I only have like 15 articles I wish to share cross all site, BUT they are the most important articles and want SEF urls on all of them.

if this is not possible, do you have a method I can share these 15 articles from the main site to my slaves with SEF urls? will i be able to then update the article and have the content change to all my slave sites?

Thanks

_____

If the site ID is not present in the menu item ID corresponding to the URL for whcih you want to hide the site id then you could create a hidden menu that correspond to multisites "single" articles (not blog or whatever).
The fact that you will use a single articles will ensure that the site_id will be saved in the menu item description.

When you are sure that the site id is present in the corresponding menu item id that is present in the URL, that means that you could simply remove the site_id parameter present in the URL.
If you had to create a hidden menu, use the "alias" associated to this menu as SEF name that you will used in the sh404SEF.

Normally the standard joomla SEF, start to get the menu item id description with all its parameters and if the site id is present, it can be removed from the URL.

_____

We have updated the "Article Sharing for JMS" to try hide the site ID when possible and perform the processing described in our previous reply.

See the change history for the procedure to update.
www.jms2win.com/faq/article-sharing-version-10x

_____

i upgraded and received this message:

Fatal error: Cannot redeclare multisitescontentbuildroute() (previously declared in /home/content/09/6774709/html/components/com_multisitescontent/router.php:62) in /home/content/09/6774709/html/components/com_multisitescontent/multisites.router.php on line 113

i removed AceSEF just to see if that would fix it. it did not.

The entire front end of the site is now down.

I fixed it. You need to remove SEF first, then remove multi-site content to upgrade.

then reinstall multi-site content, then SEF

but now i have this issue:

Warning: Invalid argument supplied for foreach() in /home/content/09/6774709/html/components/com_multisitescontent/multisites.helpers/route.php on line 112

Warning: Invalid argument supplied for foreach() in /home/content/09/6774709/html/components/com_multisitescontent/multisites.helpers/route.php on line 112

Warning: Invalid argument supplied for foreach() in /home/content/09/6774709/html/components/com_multisitescontent/multisites.helpers/route.php on line 112

on the page of all my article shared links. the SEF urls are working though

If you had read the "change history" that we mentioned, you would have see that you didn't have to unsinstall the extension but just perform as "purge converted files" in the back-end of the "multi sites content" menu.
http://www.jms2win.com/faq/article-sharing-version-10x

Which version of Joomla are you using ?
Can you also describe which setup you did in the menu.
Which layout did you used ? (Section, Category, blog, list, ...)

Because you have uninstall the extensions, I suspect that all the menu item ID contain now the reference to an older component id. Joomla (not JMS Multisites) use teh component identifier that is attributed when you have installed the extension. As you have uninstall them, then you have to re-open and re-save the menu items to ensure that the new component id is assigned for the menu items.

---

sorry ediwin. i didnt notice all the links moved from milti-site to regular after the update.

THANK YOU so much for the support!

I just re-did the menu-item everything works perfect!

Im having one more issue with AceSEF. Im able to edit the metadata for the SEF URLs i create but they will not publish. These URLs are slave specific not article shared. The values save in AceSEF but are not displayed when the page is rendered. Im mainly looking at article titles, keywords, and article descriptions not changing.

Re:acesef -
Posted by edwin2win - 2010/10/02 13:52

Sorry but this is not clear for me.
Can you describe with potential screenshot what you put and where.

Give a detailled scenario with description of wich menu, option, tabs, ... that you click, open, enter, ... to be able reproduct what you are describing.
Perhaps a video would be helpfull.

Spot on with this advice.

Thanks because it helped me also.

Rgds

Anton ;)
