JUMultithumb Image Resizer

Posted by Jweber72 - 2010/10/24 10:21

I need JMS to be compatible with JUMultithumb.

It is a popular extenstion to create smaller images on FrontPage and Blog pages from those in the article.

It creates thumbnails and I'm assuming it is having a problem with the cached image directory.

It worked perfectly with my test site which doesn't run JMS!!

Thanks,

j

Please send us this extension in the attachement of an email.
We will review it.

If this extension use the "/cache" directory, ensure that you have deployed the slave site into a specific directory and that you domain or subdomain is correctly assigned to this directory.

As mentionned in previous post, ensure that you have a specific deployed directory and have configured your domain or subdomain to be assigned to the specific directory.
In this case the "/cache" directory will be specific.

Ok, I look at the site setup and I'm not exactly sure what to change to get it the way you mean. Here is my site config http://jms2win.com/images/fbfiles/images/Site_Config.jpg

Deployed directory is EMPTY and should have a specific directory that must be the same as the one that you will put for the domain or subdomain in your HTTP Server (cPanel or other admin tool).

When the deployed directory is empty, it is assumed that you share the same directory than the master and therefore the same cache, images, ...
