Photoslide GK2

Posted by d8tabyte - 2011/01/26 17:48

When I deploy a slave site, the module loads, but the flash doesnt.

Example:

http://sportsnationnetwork.com - working
http://detroit.sportsnationnetwork.com - not working

I checked in tools section - even re-propagated to slaves with overwrite and same result.

Also, this component, is there anything you can do to make it compatible?
http://extensions.joomla.org/extensions/style-a-design/tabs-a-slides/5379

*** I know the template uses gantry, and I know there are issues with templates and gantry, I am not changing the template in anyway, it is simply a module and component issue.

I think the reason is due to other parts of your website that generate JavaScript error.
When you are displaying your page in Firefox with Firebug enable, you can see that you have 9 javascript errors.

The first one appear in the RokBox.
You have several time "RokMiN" that is not defined.
Also have an error on jq2j that is not defined.
Finally error on LyteBox that is not defined.

Is this due to the rockettheme template and gantry, or is this due to extensions not translating from master to slave, as these errors do not exist in the master.

The more I work on this, the more I think the benefits of purchasing this extension is far outweighed by its complexity. I've been doing development for 12 years and I am literally fighting with this every day just to get one successful slave site so that I can deploy my network.

I can't say this is the fault of the developer, as the extension is wonderful, if I could only better understand the tutorial videos (its a bit hard in broken english, again, fault can't be held to dev). I'm just

beyond frustrated with this system and I'm pretty much down to doing this manually.

I'll try disabling everything that you listed and see if I can't get at least the front page to load properly.

_____

As I mentionned to you previously when I connected on the link that you provided, I have saw Javascript errors that were coming from other modules.
All you must know is that a javascript error can stop the execution of the other javascript.

Concerning Gantry, the main problem is that the setting that it read from a slave site can be wrong and the rendering might be also wrong as it read the configuration defined in the master instead of the one present in the slave site.

I don't think (but not sure) that gantry itself is the origin of the problem.
I suspect other Rocket Themes module.
I don't know what is RokBox and if it is part of the gantry.

Perhaps you could try install a small test environment with a standard Joomla and just install JMS Multisites and the Photoslide GK2 to verify if you can reproduce it without anything else.
