Is iJoomla SideBars compatible with MultiSites? I had to enter a primary site URL in order to download it. It seems to work in the master site, but not a slave site. Below is a typical error on the slave site

Warning: mysql\_num\_rows(): supplied argument is not a valid MySQL result resource in /home/master/public\_html/master01/libraries/joomla/database/database/mysql.php on line 344

## Re: iJoomla SideBars compatibility Posted by edwin2win - 2011/02/14 20:05

I never reviewed this iJoomla SiteBars.
