

## Zoo 2.4.16 Including all Apps and Tools

Posted by jari646 - 2011/09/30 14:18

---

MultiSites should be compatible with Zoo?

When I install Zoo 2.4.16 Including all Apps and Tools, I get blank pages in all my slave sites. Why is that?

Thanks

---

Blank page is the symptom of a PHP Fatal Error somewhere.  
So check your "error log" to get more info on the Fatal Error.  
In general this give you the source and line where there is a fatal error.

Hi,

This is what I found in error log

```
PHP Fatal error: Class 'systemHelper' not found in
/home/autoviih/public_html/administrator/components/com_zoo/framework/classes/app.php on line 138
PHP Fatal error: Class 'systemHelper' not found in
/home/autoviih/public_html/administrator/components/com_zoo/framework/classes/app.php on line 138

Is there way to solve this, or do I just have to forget this? What is your opinion?

I have the same problem. Until this issue is resolved I can not access my sites administration slaves because I get a blank page with this error ".../ components / com\_zoo / framework / classes / app.php on line 138 ". Please give us a solution soon. The Zoo component is as important as Win2Win for our work. We can not go on with this problem without sacrificing one of the two components. Please.

The JPATH\_ROOT directory is correct but if an extension is using the PHP dirname( \_\_FILE\_\_ ) to recompute and simulate the JPATH\_ROOT then they may have problems when a file is located in a Symbolic Link directory. In this case, the system return the physical path and not the symbolic link path.

If Zoo use all the time the JPATH\_ROOT, this should not be a problem and it is guarantee that you are located in the Joomla root direction either from a symbolic link path or a physical path depending the apache document root directory.

Here Zoo, didn't give any detailed information on the source and line of code that would have a problem in Zoo.

If you can get more info on the peace of code in Zoo that cause the problem, please post the info.
