Multisite not working on slave site after update

Posted by erganov - 2010/04/15 05:35

Hi Edwin,
some months ago I create three slave sites. And it was successful. The slave sites are:
- photography
- fotografi
- ftp_layer

After I upgrade Multisite to:
Joomla Multi Sites version: 1.2.26
Patches definition version: 1.2.32

I create two slave sites:
- motorcycle
- traveler

But, the two last slave read master configuration.php, not the slave configuration.php itself. So, if I login to the administrator on motorcycle, it goes to master administrator page with master configuration.php . It's different if I go to photography administrator, it is working.

How can this happen?

This is site manager screen capture:
