Warning: symlink() [function.symlink]:

Posted by iostream01 - 2010/07/05 10:18

Hi,

I had tried to make a slave site on Joomla Back-end and it works fine. But when i try creating a slave site on the Front-end. I got this error :

Warning: symlink() : No such file or directory in /home/domain/public_html/administrator/components/com_multisites/models/manage.php on line 1225

Warning: Invalid argument supplied for foreach() in /home/domain/public_html/administrator/components/com_jfusion/models/model.jfusion.php on line 354

Warning: Invalid argument supplied for foreach() in /home/domain/public_html/plugins/user/jfusion.php on line 593
could not sellect to the Joomla database

Status Upon Creating Slave Site on Front-End
Database Duplication: Fine
Folders/Files Deploy : Failed

Your response is greatly appreciated.

Thanks,
Norman

Which version of JMS Multisites are you using ?
The latest version is 1.2.32
See FAQ if you need to update your JMS
http://www.jms2win.com/faq#sec-122

Hi edwin;

we're both working on the same site
JMS version 1.2.31
Unix Symbolic Links: Allowed

we're trying the latest version and the same error happened.
JMS version 1.2.32

thanks,
ryscript

_____

If you have tried on the JMS Version 1.2.32 and have the same error message, I don't understand it as the symlink does not exists at the line reported.

Would you please give us the error message that you have with the version 1.2.32

_____

Hi edwin thanks for your quick reply,

Warning: symlink() : No such file or directory in /home/domain/public_html/administrator/components/com_multisites/models/manage.php on line 1278

Warning: Invalid argument supplied for foreach() in /home/domain/public_html/administrator/components/com_jfusion/models/model.jfusion.php on line 354

Warning: Invalid argument supplied for foreach() in /home/domain/public_html/plugins/user/jfusion.php on line 593

could not sellect to the Joomla database

that is the error in the latest JMS version

==========

and can you please suggest what are wrong in our template configuration.

List of Domain Name: http://www.domain.com/{site_alias}
To site ID: {site_alias}
New DB Prefix: {site_prefix}_
Desploy Folder: {root}/{site_alias}
Alias link: http://www.domain.com/{site_alias}

yeah if we remove the Alias link the Warning: symlink() : is gone but the two other errors still remain..

thanks,
ryscript

_____

The alias link must be a directory and this is normal that you don't have such directory on your disk.
Probably you want to write {root}/{site_alias}
{root} correspond to the full path corresponding to the domain.

In your description, it seems that you want twice deploy the slave site in the same directory than the alias.
Deploy folder and alias link are used when you want 2 directories linked together.

For example deploy the slave site into {site_dir} and create a link to this directory from {root}/{site_id}

_____

hi Edwin,

even we remove the alias link we still getting the error.. I don't know what this error main.. please help me..

but when I put an ID in the front-end it works and the template configuration uses ID's also..

any solution please, I don't want to show the ID's the front-end field and I want only the {site_alias} in the template configuration..

any reply is greatly appreciated.

thanks
ryscript
