JEvents Latest Events Module
Posted by IanM - 2010/12/01 18:12

I've started to get the following error in my slave sites when adding or editing a JEvents Latest Events module.

Fatal error: Call to a member function getMenu() on a non-object in .../public_html/administrator/components/com_jevents/elements/jevmenu.php on line 47

I posted in the JEvents forum and was told that this is the code in question:

```
 $menu =& JApplication::getMenu('site', $options);
     $menuItems = $menu->getMenu();
```

Can you shed any light on this problem?

The error message means that

$menu =& JApplication::getMenu('site', $options);

return a "$menu" that is probably null or empty or false.
This is not a "menu object" that explain why the
$menu->getMenu();
generate this fatal error.

I'm sorry but I don't understand what that means. All I know is that the module works on the master site but not on the slave sites. Is there any trouble shooting I can do?

If you want to know more concerning the reason, I think you should try debug the code and try identify which extension (plugin, module, ...) call this line and in which content. Perhaps this will give you an

indication on the reason.

If you want that we debug Joomla on your environment to tell you the conditions that generate this fatal error, this is possible with our billable support that you can order at http://www.jms2win.com/download?page=shop.product_details&flypage=flypage.tpl&product_id=35&category_id=1
