Problem with new sh404sef and multisites

Posted by jari646 - 2011/02/10 19:45

I have installed new version of sh404sef and I accounted one big problem in my website. The Virtuemart (K2 mart) cart does not work anymore.
In my test site (it does not have Multisites) everything works fine.

I have Check patches installation, but one of the patch does not stay installed?
Please see attachment.

Thanks

Best regards,
Jari

Which version of JMS Multisites do you use ?
Do you have the latest version installed ?
Which version of sh404sef ?

If you are using the latest version of JMS Multisites, please send us the sh404sef extension in the attachement of an email to allow us review this latest version.
The latest that we reviewed was the sh404sef 2.0.3.

Hi,

Any news for this problem?

Thanks

I am working on the new version 2.2.2.
I just see that they tried integrate a "multisites" functionalities in this new version to avoid sharing the same cache content. They are using the "live site" parameter present in the "configuration.php" to make the cache specific.

I think they missed some update as I still found the front-end the usage of their "old" cache name.

I am continuing the investigation

Graet news that you are working to solve this issue :)

Thank you very much

Hi,

Do you have any news for this problem? Any time table when you will publish new version?

Is it days, weeks, or more? I need to get some decitions, what to do with our websites.

Sorry for pressure you, but I am gettign lot of pressure, because our sites SEF url:s don't work :(
Thanks

I didn't yet found which is the problem.
All I can tell you is that they change their algorithm and that the remaining file that we patch concern a patch that should be replace by a new implement that sh404sef have to implement if they want to be consistent in their implemnetation between the back-end and the front-end.

Their new algorithm compute the cache in the back-end based on the "live url" parameter and in the front-end is an hardcoded cache name (the old name).

So if you are not happy with their latest sh404sef version, I suggest that you use an older one (ie. 2.0.3)

Hi,

I can not get older sh404sef version anywhere. So I am little stuck.

How about AceSEF? Does newest version work with MultiSites? I don't know what to do :(

Perhaps you could report the bug to sh404.

Concerning AceSEF, the latest that I reviewed is 1.5.13 and for the moment, we never had report of a potential problem with AceSEF. So it is supposed to be OK.

Hi,

Have you find solution for this problem?

No, I have not started to fix the bugs present in the sh404 extension.
Perhaps you should report them the bug or use an older sh404 version.
The bugs are introduced in the refactoring of the sh404.

I am afraid now. I want to buy your extension as I have to build a sub-website, but I am using sh404sef at the moment. I tried Virtual domains to change the template on the second site, but it is not working with sh404sef activated. That's why I have had a look at jms2win.

Before I'll buy this component, please tell me if I can do this:

I have a site running sh404sef, K2, Kunena and JomSocial and want to build a similar website which is displaying a different K2 and forum category (which shouldn't be a problem) and use all the users of JomSocial. I want them to be able to log in on both sites.

All the links are processed by sh404sef. Without it my site won't work (esp. Kunena).

Will your component be the right one for me? What if it doesn't work? Will you refund PayPal?

Thank you in advance.

_____

Concerning the sh404sef, the latest version that we reviewed is the 2.2.2.
Perhaps they have a new version that fix their bugs inside the sh404sef after they totally revamped their code.

Concerning K2 and Kunena, there is no problem.

As explained in our FAQ and refund policy, we do not refund as soon as you have downloaded the product
http://www.jms2win.com/en/refund-policy
