Menu Sharing
Posted by vinod - 2011/03/21 13:34

Hi,

I have configured jms multisite successfully now it is working fine.
I need to show the slave site same like master site including content,menu..etc
I have configured virtuemart also, In slave site I have to show only slave site products and categories alone.

We need to show all slave site categories,subcategories and products in master site

Kindly let me know how to achive this.

I don't see the relationship between this thread title and the description that you give.

Sharing menu is not directly possible.
We propose a "Multisites Menu Item" extension that allows you creating a kind of sharing between the item of a menu. Not the menu itself.

Concerning the other question concerning the possibility to see all the VirtueMart products in the master, this is only possible when you share the VirtueMart extension between a master and the slaves but in this case, all the slave will also have all the products information.

So you can share the whole content of an extension or nothing but not partially.

The concept of the sharing is to share the MySQL tables used by the extension.
Sharing the table means that you share all the records. In other words, you share all the products, categories, ... (everything) and not only few records.

What you request is the "Multisites VirtueMart" that would be able, like our "Article Sharing for JMS" to read specific records of VirtueMart.
This extension does not exists.
The only thing that you could do is to share the whole VirtueMart and modify the VirtueMart PHP code to just display few categories depending on the websites.
This will require to modify VirtueMart itself and is not necessary easy to develop.

Another solution would be to keep the virtuemart independent and develop a module or a component that would be able to display the list of product that exists in the other websites.
If you want that we develop such kind of extension or modifying the virtuemart to filter things, this kind be analyzed and developed with our billable support that you can order at
http://www.jms2win.com/en/joomla-multisite?page=shop.product_details&flypage=flypage_multisites.tpl&product_id=35&category_id=1
This may require several days of development.

Thank you for your suggestion

In which way we can easily achieve the above functionality.

When we are developing the separate module or component for displaying the products in master site (With out sharing the virtuemart),I made some code changes on virtuemart design I think it will not refelect in slaves...
How to resolve this issue...

Hi Edwin,

How to get the slave site id in code level..while navigating to that site..

It is very easy to know if you are in a slave site or in the master and how to get the current site ID.

here it is a sample peace of code for that

```
if ( defined( 'MULTISITES_ID')) {
   // This is a slave site
   $site_id = MULTISITES_ID;
}
else {
   // This is the master
   $site_id = ':master_db:';
}
```

_____

I have to find out site id in some other component like virtuemart and community builder.
Based on that site Id I need to do some actions(make change on that component) in that component.So what are the files need to include and how to get some where else.

_____

You don't need to include any files to have the MULTISITES_ID defined present.
This defined is declared by JMS Multisites when this is a slave site.
As this is a "define", you don't need to declare anything to have the define present.
It is always present like a global parameter.

_____

What are the features we have in using jms - virtuemart bridge.

==========

Re: Menu Sharing
Posted by edwin2win - 2011/03/31 20:07

_____

As explained in the product detail
http://www.jms2win.com/en/joomla-multisite?page=shop.product_details&flypage=flypage_multisites.tpl&product_id=33&category_id=1

This is a plugin that is a kind of bridge or gateway between Jms Multi Sites and VirtueMart when you want to propose a service to sale the website creation from the front-end.
In this case, in addition to create a website, you need to have a system where to place an order and proceed to its payment. In our case, we propose a bridge with VirtueMart to process the website creation ordering until its payment.
The bridge communicate with Jms Multi Sites to build the VM shopping cart and also process all the VM order status modification in aim to update the slave site status.

Hi,
In My case I have created the slave site from front end,It will automatically generate the database prefix as like u62slave11 but folder name as slave11.How to find the relation between this, is there any specific file have these details. I need this info for to make the url formation,I need to redirect the page based on site id.

==========

Re: Menu Sharing
Posted by edwin2win - 2011/04/01 13:11

It seems that you have defined a Site ID rule that use the {site_prefix} and the DB prefix that is u{user_id}{site_prefix}.

If your site ID correspond to the site prefix, you can rebuild the rule to get the DB prefix.

The relationship is the one that you have defined in your JMS Template rule and my analysis is correct correspond to the value that you have setup in your rule.

If you want to get more info concerning the site ID, see user manual chapter 4

Re: Menu Sharing

Posted by edwin2win - 2011/04/04 18:37

You don't find any table for the Jms Multi Sites extension as we don't save anything in the DB as we need to get the information before that joomla start and before any DB connection.

If you want to automatically redirect a user to a specific website, you have to imagine a rule somewhere that create the relationship between the user login and the slave site.

If you use the "owner" field that is associated to a slave site, you could perhaps retreive the list of slave site that is owned by a particular user.
The problem is what you are doing when you have several websites assigned to a given user?

So if you propose a service to create websites from the front-end, you can limit the number of website to 1 in the JMS Template rule (Maximum Website per user).

If you want to create a plugin and have access to some website information, see the chapter 4 of the user manual that descrbe some API to get info from a specific website.

If you want that we develop a specific plugin for you, this is something that we can do with our billable support that you can order at
http://www.jms2win.com/en/joomla-multisite?page=shop.product_details&flypage=flypage_multisites.tpl&product_id=35&category_id=1
