Restore?
Posted by simpt - 2011/04/29 15:25

Hi

Can you please explain to me, how I restore Missing db-server, DB, Prefix and user i manage site?

Templates: Missing From DB and From DB Prefix?

I have tried to restore the whole jos_ database manual with MySQL PhPMyAdmin, but it's not works.

I can make new slave site - no problem :)Its just the old sites, I can't use!

Regards
Simon

The column that are displayed there (DB server, DB, prefix, user) contain the value present in the configuration.php file that is located in the "deployed directory" of the slave site.

So if you slave site make reference to a deployed directory that does not exists, this mean that the "configuration.php" is not present and the DB connection can not be retreived.

So check that you have the correct "deployed folder" value for each website and that it effectivelly correspond to the location where the slave site is present.

Thank you. I found the error.

I am sure that a complete backup with Akeeba/installer succeeded incl database and JMS multisites.

Thanks for a cool software :)

Regards
Simon
