problem with new sh404sef

Posted by suyogdixit - 2011/09/17 08:42

I know that multisite is not currently supporting sh404sef.

I actually want sh404sef on my master website and I dont want it on my sub domain website as it will not support there.

Both multisite and sh404sef are of latest versions.

I created sub-domain website just as you instructed me on Skype and Teamviewer Support.

But I am stuct into a big problem, Whenever I try to uninstall sh404sef from Tools Menu from sub domain website, Admin login to sub domain gives following error:

Fatal error: Call to undefined function shfileexists() in /home/HIDDEN/public_html/plugins/system/shjlang16/jlanguage16.php on line 382

or

When I try to disable sh404sef from sub domain, sh404sef of master websites gets disabled.

AND

When I keep it enabled, all links from frontend becomes 404 error.

Please help me. :huh:
