error 500 with Joomla 1.7.1 and JMS V1.2.65

Posted by Master01Bruno - 2011/10/02 13:25

Hi,

I've just update my joomla from 1.7 to 1.7.1 with my JMS V1.2.62

after the joomla update, i cant access to the JMS manager

the error is :

error 500
JDatabase patch is not installed

i've installed the last version of JMS V1.2.65

the error is the same

I've test the other composant in my joomla and i dont see any other problem, only with JMS

could you help me

Many thanks

Bruno

You absolutelly need the patch for the DB.
So verify that you have permission to apply the patch on the file.

I'm sorry, i dont understand your answer

before to updating joomla, my joomla was 1.7 and my JMS was 1.2.62 and all was ok without any error

in the admin of JMS

i've update to joomla 1.7.1 and stay with JMS 1.2.62 and the error appear

so i've update to JMS 1.2.64 and the joomla update manager say the the update of JMS are good but the error in the JMS admin stay.

so witch permission do you talk ? DB permission or Files permissions ?

I'vent change the permission after updating joomla so how could it change ?

Where can i find the JDatabase patch and how can i install it ?

Many thanks to help me

Bruno

_____

Hello Master01Bruno
In your master Joomla you must change the permissions from 0444 to 0777 in the configuration.php file, then in the multisites component -> Check patches installation -> click on the botton Uninstall and click again on the botton Install.

Thats worked for me.
MSM :)
I love this component!!!

_____

Hi raymondorta,

thanks to help me

I'm not sure it's good to open the permission of the configuration.php file from 444 to 777

So i've test first to uninstall the patch installation and re install and all are OK now without changing any permission.

raymondorta, dont forget to put the configuration.php file in 444 if you dont want someone could hack yours websites

Many thanks to raymondorta and edwin2win

I love this component too

Bests regards

Bruno
