can not create template without deployment dir

Posted by ashdodia - 2011/11/09 13:21

Hello,

I'm using Joomla 1.7.2 and JMS 1.2.68

I'm trying to create new template that will use the same file system as the master file so I leave the deployment directory field empty.

As soon as I hit the save button I get an error message "invalid index: deploy_dir"

If I'm trying to create a new site from master without template but with a new DB, I get error message "invalid index: table".

Thanks,
Saar.

For each message, would you please to give also the source file name and line number that is probably corresponding to each message.

In addition, I don't this is reported as an error mesasge but probably as a "notice message".
