Deleting a slave causes 500 error, crashes server

Posted by eddie_konczal - 2011/12/08 20:02

_____

I have discovered that whenever I delete a slave site that has been successfully created and configured, I get the following error for not only the JMS Multisites Joomla site, but ALL sites running on the same web server:

500 - An error has occurred.

Unable to load Cache Controller: callback

The front end of the master site shows:

"Infinite loop detected in JError"

We need to restart the web server in order to log back in our Joomla! sites.

We are using Joomla! 1.7.3 and JMS Multisites 1.2.68

_____

The "Infinite loop detected in JError" joomla error message is generally correspond to a wrong DB connection parameters.
When Joomla has an error to connect on the DB, it tries to report an error that itself generate a error recursivelly.

Verify the DB connection parameters (host, DB name, DB user, DB password, DB prefix).
