# Create slave from another host

Posted by celso - 2011/12/19 11:38

---

Hi Edwin,

I´m working on debian 6 (without any plesk or cpanel)& last version of jms. When I try to create a slave site on another host (ej, www.masterdomain.com to pages.masterdomain.com) appear a message like "the directory (var/www/pages.masterdomain.com) doesn´t exist".

I think is a permission problem but de owner of two host are the same and the same like apache. Openbasedir value is none.

Any idea please?
Thank you very much

When you say host, do you mean different server or different account on the same server.

I also suspect a permission issue and I am wondering if you are using the same "owner" for the files and folders.

Check the ownership of the files and folders.

Hi Edwin,

Thanks for your help I mean different account on the same server. I checked the permission and I found a error in ownership and now it works fine.

Thanks
