a lot of problems after migration

Posted by staeren - 2012/02/04 22:04

---

hello, please some urgent help. We have errors after migration to another server. All absolute links refering to /home5/farmatoo/public_html/khb have to be changed to /home/mijnkwal/public_html. How can i fix this quickly in our 16 slave sites? the master joomla site is working correct, but i don't know in which files i have to change these absolute urls...

See the procedure in the FAQ concerning the manual backup/restore procedure.

If you have changed the path on the disk and also the symbolic link to your master then you have to delete the symbolic link and update your deploy folder value in each slave site definition that you will resave.
This will rebuild the new links with the new path.
