Custom HTML Module (Child Issue)

Posted by kyledesu - 2012/02/07 10:52

Not sure if I'm doing something wrong but I have it working on a slave site but not the children of the slave

Using

Version 1.2.72 (Latest available: 1.2.75)
Patches definition Version 1.2.76 (Latest available: 1.2.77)

With joomla Version 1.5.23

BTW, the child sites to see the modules in the Admin side they just are not displaying or I get

Fatal error: Call to a member function setQuery() on a non-object in /master/modules/mod_multisites_custom/helper.php on line 52

This mean that you have a "Multisites Custom HTML" module that make reference to a slave site where the DB connection is wrong and that it can not be opened.

Verify the site ID used in the "Multisites Custom HTML" and verify that they make reference to a valid DB connection. Perhaps you changed a DB passowrd or another parameters that does not allow to connect on the site ID DB

How do I verify this?
Nothing was changed on the DB side

Slave site works fine to master and subs, but sub sites of the slave do not

This is what happens if I use the slave_child to the Master

JDatabase::getInstance: Could not connect to database
joomla.library:1064 - You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use near ') AND c.published = 1 AND c.access

==========

Similar thing is happening with
Multi Sites Menu Item

using
Mysql 5.1.56-log
PHP 5.2.17

The reason is that you have a DB Connection error on a specific website.

Based on the table prefix and your DB query, you should be able to identify in which website there is a call and therefore verify the DB connection in the "configuration.php" file.

Here, you seems perform a connection on the website with table prefix = "atl_"
So try identifying which Site ID correspond to this prefix.

This still makes no sense, the configuration.php files seem fine unless the program is suppose to add another database connection.

I mean I get there is something wrong with the connection but how? Everything was created within Multisites and I know its accessing other shared content already.

Update I can get the slave child to access the Master but no data is displayed
The slave can access any of them..

Perhaps you have a physical copy of the "/multisites" directory in the slave site that would have another information than in the master.

Check the kind of "multisites" directory that you have in the slave site.
Do you have a physical directory or a symbolic link or nothing ?

Bingo this is it.. There was no /multisites dir
Thanks..
