upgrade on J2.5 : Problem with templates (design)

Posted by titus - 2012/03/10 19:09

Hi edwin,

I have some problem with upgrade on Joomla 2.5.
I have put the last JMS release, upgrade to last version all my extesions,...
Reinstall all my gantry templates for J2.5.
And resave every of my subsites (template sites).

But i have some problem with templates Rockettheme. In fact i can't deploy them on my subsites. They install well on my master website, but i can't install them on my subsites.

I have the error sentence "... not install on master..."
I try creating a new subsite... same way. Template is not replicate on subsite and nore it is possible to install it.

Seems there is a change on gantry or in there templates.
Result is that all my websites are down as soon as i have no templates.

Have you got a feedback for that ?
Thanks in advance,
Regards,

==========

In fact, i try installing a template without gantry.... And i have the same problem.
It will be so cool, if we can deploy templates as component and extension... ;)

Joomla 2.5 changed the way that are saw by the slave site.
Now you have to go in the Joomla extension manager and the "discover" menu to make the template discovered in the slave site.

Install a template in the master is no more automatically detected by joomla 2.5 that now require the usage of the discover.

If your slave site is not defined to allow re-installing templates from the slave site, you can not do it. To allow a slave site be able to install its own template, you need to put in the "template folder" =

{deploy_dir}/templates

I've tried that way... results the same (about rocketheme template, not try for other)
Joomla say me, the template is well installed and i can see it on my templates (on joomla menu) but it is not installed on {deploy_dir}/templates
I sent the files via ftp... Don't work more.

This mean the the templates is not correctly packages and that you have to contact Roket Themes to have an install that works perfectly on Joomla and also with the "discovery".
