[Solved]Slave is not conecting - configuration.php

Posted by diogowernik - 2012/03/28 18:16

Hi,

my joomla is 2.5.3
Joomla Multi Sites version: 1.2.78
Patches definition version: 1.2.80

i created a slave site, with shared users and shared community builder!

Master

DB - master_site
DB user - master_user

Slave

DB - slave_site
DB user - master_user

the configuration.php is correct, the multisites configuration is correct, but the slave site is connected with the master_site database, what i have to do to make the slave site conect with its own DB?

Thanks very much

Verify that you correctly spelled the domain name in the slave site definition.

The test perform by JMS is case sensitive.
In addition, verify that you have entered the domain with and without the WWW

Some server add or remove the www in front of the URL.

Also verify that you have received a "blue" message when saving the slave site definition.
A red message will not result with a correct slave site definition and might display the master like when the slave site is not defined.

Also ensure that you didn't setup your HTTP Server with a redirection to the master because this mean that you want to display the master.

_____

hi,

thanks it worked

It was with a "red" message when i was saving, was something about the multisites templates, htaccess.txt, that i changed to .htaccess ...

So i updated the template and than updated the site and now is great!

Thanks very much!
Diogo
