One database, many websites

Posted by Johan - 2013/03/14 09:37

Hi,
I work for a company and i have to develop a website like this :

- an introduction page where I choose a city(ex : Paris, Lyon)
- All city/website share the same template and have shared content and also their own content.
- I have some PHP modules which use SQL queries to do something according to the city chose.
- I would like to be able to easily change the shared content of all cities, change the background for all .....

Is it possible to do all that things with the JMS multi sites extension ?

(Sorry for my english :unsure:)

Edit : I have to do exactly the same website as http://www.soccer5.fr/ but using Joomla to have a better managing system.

First, you seems a french person.
We are speaker at the joomla day (toulouse) the 23-24 march.
So if you want to meet us, you are welcome
See http://www.joomladay.fr

If you want that we create a specific sharing for your extension to share some specific thing, when the consistency of the date is OK, we can create a specific plugin that would add this specific content sharing.
We do that with our billable support and in general, this can be done in 1 hour of support.

I also speak french. The french is my native language.
