SSI Domains plugin is not working

Posted by genxter - 2013/03/06 23:43

Hello,
I bought the SSI Domains plugin but somehow it is not working.
I am using the newest multisite component and joomla 2.5.9.
Plugin is active and I can configure the slave website. The plugin is also installed in the slave website.
But on both websites the plugin is not coming up when I look in the source page.

In the manual I can find the hint with the troubleshooting:

But I cannot find it. So, somehow the plugin is not active!?

Verify the configuration of the plugin.

Do you have requested an automatic computation for the domain or provided a specific list of domains ?
In automatic, this is based on the sharing of the users between websites.
If you didn't shared the users between the websites, the plugin does not display the script as there is no user sharing.

Do you have requested to make the plugin computing only on the back-end or do you have enabled on the front-end or both ?

So verify that you share the users and the domain is part of the list of domain (either computed automatically) or provided manually.
