SSI Domain not working

Posted by thomaskremer - 2013/05/12 16:06

Hello,
I just purchased your single sign-in plugin, but I can't get it work. I did everything described in the manual (section 4.1) for installing ssi domainssame on one website accessed via several domains (so I didn't install JMS multisites, but just one joomla installation with different sections for several domains). Same joomla installation, so same database and same secret code.
Whatever I do, the returned value of ssidomain_login = false.

What could this be?
Thanks

Thomas

Weird. It's working now.
Maybe it was a problem of the caching system...

Thanks for this SSI domain solution I was looking for since a few years!
