Transfer site from cpanel(WHM) to amazon server

What we did :
1. We backup our site (.zip) where JMS was successfully installed.

2. And transfer the backup to amazon server and we changed the content in the "/multisites/config_multisites.php" and deleted the "master" cookies and master directory path as per http://www.jms2win.com/en/faq

3. After deployment , when we check JMS in administrator component Product ID was changed which is not registered as we already purchased JMS having our own Product ID.

Because of this we can not create freshSlaveDomain with symbolic links.

Can you please help us to solve this ?

When you move an installation from one place to another one, the JMS product ID is modified and as you can register an unlimited number of times, you just have to register the new installation with its new location.

Go in the "about us" menu and you will find a the "registeration" button.
